

SIPAT score—predicted probabilities for any adverse outcome (medical + psychosocial) [3].

($n = 217$)

Cutoff: SIPAT overall score ≥ 21

Other Global Assessments

Global Assessments

- Transplant Evaluation and Rating Scale (TERS)
 - Scores on a 3-point scale from good to moderate to insufficient in 10 psychosocial domains
 - Proposed cutoffs for transplant evaluation are TERS < 29 points (excellent candidate) and TERS ≥ 29 (moderate-risk candidate)
- Psychosocial Assessment of Candidates for Transplantation (PACT)
 - 4 psychosocial domains (social support, psychological health, lifestyle factors, and comprehension of transplant)
 - Validated for adults and pediatrics
 - PACT score < 2 used to identify patients that should receive treatment to improve psychosocial risks before being listed for transplant

mPACT			
I. Social Support		II. Psychological Health	
1. Family and Support System Stability		1. Patient Motivation for Device	
No relationship	0	Doing it for others	0
Strained relationships	1	Reluctance/Some willingness	1
Stable relationships	2	Forward looking/eager to engage	2
2. Family and Support System Means		2. Psychopathology, Personality Factors
