

Previous (limited) evidence shows equivalent or worse outcomes associated with sodium bicarbonate administration in cardiac arrest.

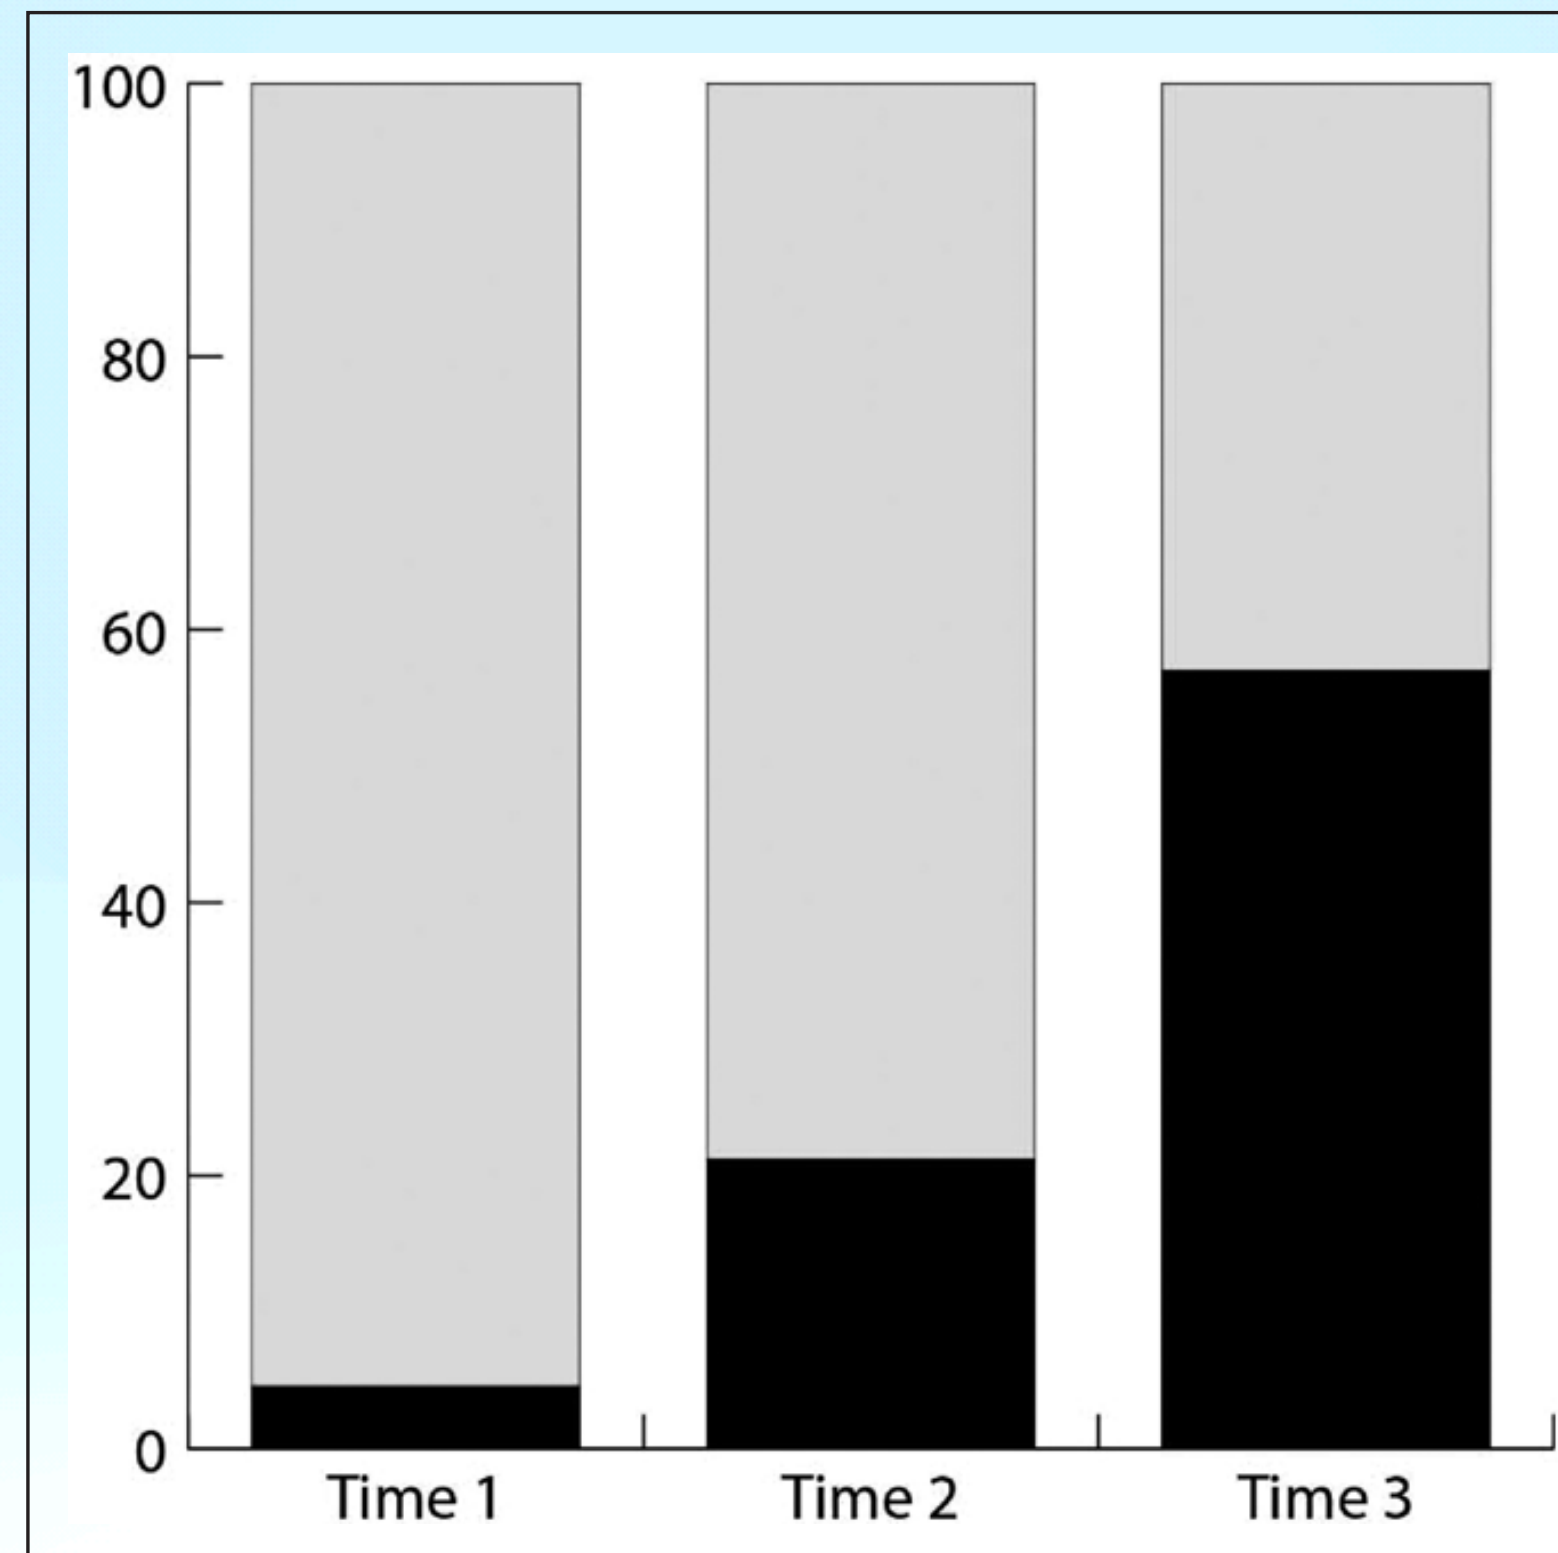

Figure 3. Respondent preferences regarding sodium bicarbonate administration during the resuscitation of pediatric cardiac arrest. Stacked bar graph illustrating the percentage of respondents who would and would not administer sodium bicarbonate at each time point in the scenario. *Black bar* = yes, I would administer sodium bicarbonate at this time; *gray bar* = no, I would not administer sodium bicarbonate at this time; *x-axis* = time point in scenario; *y-axis* = percentage of respondents.

Correlation or Causation?
